### Rapid Antigen Tests

COVID-19 rapid antigen tests may be used to detect possible infection with SARS-CoV-2 (COVID-19). Negative test results do not exclude infection with COVID-19 (face masks, social distancing and good hygiene practices must be maintained). Follow current Government health messaging regarding confirmatory testing requirements. The COVID-19 rapid antigen tests are being supplied for self-testing (unsupervised testing in the home or other environment). ALWAYS READ THE LABEL AND FOLLOW THE DIRECTIONS FOR USE.

While COVID-19 rapid antigen tests are an important supplementary tool for use in efforts to curb the spread of COVID-19, they do not provide a diagnosis of COVID-19 infection. Only PCR testing is recognised as appropriate for providing definitive diagnosis of infection.
